

Multi-Cloud Self-Service & DevOps Orchestration

Morpheus is the only proven enterprise cloud management platform to provide a systematic approach to cost optimization, governance policy, DevOps automation, and day-2 operations.

Everyone is turning into a software company but that doesn't mean everybody is good at it

Organizations in virtually every industry are using software innovation to differentiate themselves and grow into new markets. Over 80% of businesses expect to have DevOps and cloud-first processes by 2020 to support digital transformation.

Unfortunately, it can still take IT weeks to deliver new services to developers which has given rise to hybrid IT and multi-cloud options. This in turn causes other issues like:

- High costs and lack of visibility
- Security and governance blind spots
- Brittle approaches to automation
- Poor application life-cycle integration

Morpheus is a 100% agnostic cloud management platform (CMP) that enables unified multi-cloud self-service and DevOps orchestration

It's a foundation to bridge the gap between teams, tools, and processes independent of where and how applications are deployed.

Unlike greenfield tools or those that force you to rip and replace existing processes, we empower you to manage things your way - just much faster and more efficiently with zero lock-in.

We enable Developers and Operations teams to serve the needs of the Business by delivering on what each needs to be successful.

- For **Infrastructure & Ops**, we standardize management and governance of what would otherwise be a heterogeneous mix of disconnected cloud platforms and tools.
- For **Developers**, we enable speed with self-service deployment, a full fidelity API/CLI plus a blueprinting and automation engine to accelerate application modernization.
- For **Business teams**, we assure compliance, enable visibility and rightsizing of brownfields, plus include a comprehensive reporting and policy engine for new workloads.

A systematic approach can eliminate tool sprawl and centralize app life-cycle management

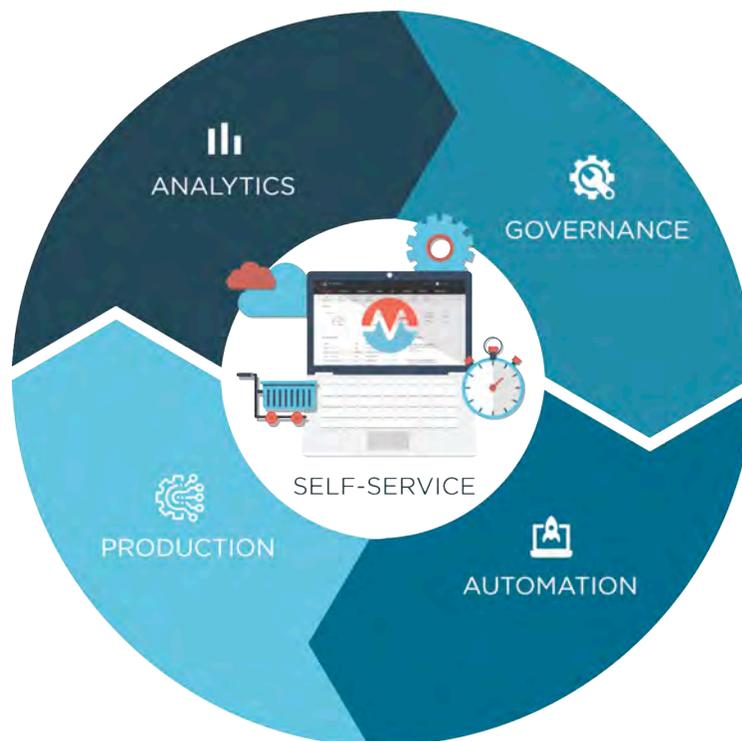

Self-service provisioning is at the core of what we do, but we go beyond to address all cloud management functions in a single platform.

- **Analytics:** reduce cloud costs by 30% with discovery and guided rightsizing
- **Governance:** fine grained role-based access, multi-tenancy and policy enforcement
- **Automation:** enable CI/CD with integration into DevOps tool chains
- **Production:** support day-2 ops like monitoring, logs, backup, and scaling

You will massively reduce the time spent in other tools by pulling common tasks into a single interface built for speed and simplicity. Plus, Morpheus provides everything to manage apps from start to finish and easily to move from Dev to Test to Production.

Why are some of the largest enterprises and service providers standardizing on Morpheus?

- **100% Agnostic:** Offerings from VMware, RedHat, Cisco, etc. suffer from narrow focus on one stack. Our customers choose a broader view and want a vendor management strategy as much as a unified CMP.
- **Depth and Breadth:** Unlike complicated 'plug-in ecosystems' or 'web hook' designs, we uniquely manage 75+ third-party integrations across a majority of enterprise tools and clouds so you can be up and running in under an hour.
- **Native App Services:** In addition to integrations, Morpheus has built-in services for image creation and migration, IPAM, DNS, Secret Management, File Repo, Monitoring, Logging, Backup, Load Balancing, and more.
- **Agile Development:** We are a true DevOps with agile releases that add new features every few weeks. In a cloud and development ecosystem that is changing daily being able to keep up is a critical success factor.
